

Abstract

A food packaging closure apparatus comprising a tubular body and a removable lid is designed to be positioned on a food product that is packaged in tightly-wrapped packaging when the food product has been opened by cutting through the packaging and a portion of the food product, exposing a surface of the food product. The tubular body is designed to be attached in a sealing engagement on the exterior surface of the food product packaging, surrounding the exposed surface of the food product. The lid is removably attachable to the tubular body to seal over the exposed surface of the food product.
